Table 1: Perticker daily sentiment coverage and variability.
comp_mean is the perday composite (pos – neg).

Ticker	Days	Mean(comp_mean)	Std(comp_mean)	Headlines/Day
META	25	−0.150	0.621	1.12
TSLA	5	−0.151	0.844	1.00
NVDA	2	0.067	1.116	1.00
MSFT	2	0.558	0.489	1.00
JPM	2	−0.714	0.346	1.00
AAPL	2	0.431	0.309	1.00
AMZN	1	0.003	—	1.00

Abstract

This is a report wired to pipeline artifacts. Re-run your pipeline to refresh figures/tables, then make report.

1 Introduction

Briefly describe problem, data, and approach.

2 Results

Figure ?? shows current metrics.

Figure 1: Model metrics (auto-generated by pipeline).

2.1 Daily Ticker Sentiment (Sanity Check)

We aggregate headline-level FinBERT scores to perticker, perday sentiment and observe meaningful variation outside of earnings dates. In our 2022–2024 sample, we obtain 39 tickerdays across 7 tickers (42 headlines total). The composite sentiment (pos – neg) shows broad dispersion (overall mean −0.10, std 0.65, interquartile range [−0.74, 0.26]), indicating the signal is not flat and can serve as a foundation for features. These diagnostics suggest sufficient daytoday variation to justify building both general (marketwide) and tickerspecific sentiment features for use around earnings events.

3 Conclusion

Summarize findings and next steps.

Temporary page!

L^AT_EX was unable to guess the total number of pages correctly. As there was some unprocessed data that should have been added to the final page this extra page has been added to receive it.

If you rerun the document (without altering it) this surplus page will go away, because L^AT_EX now knows how many pages to expect for this document.
